

LAPTOP ROPE PULLING EXERCISER

ABSTRACT OF THE DISCLOSURE

A laptop rope pulling exerciser is composed of a base, an operating device, and
5 a resistance device. The base includes two arched portions recessed inwards
respectively at two sides thereof for positioning the user's two laps and a wedged
portion at a top end thereof. The operating device includes an elongated housing having
a wedging portion positioned respectively at a bottom side of the housing and connected
with the wedged portion, two chin portions extending outwards horizontally
10 respectively from a top end and a bottom end of the housing, a plurality of pulleys
mounted inside the housing, an interfering portion, and a continuous rope extending
through the pulleys and the interfering portion for running inside and outside the
housing between the two chin portions. The resistance device is adjustably mounted
inside the housing for causing the rope to be tightened or loosened.
